Dear Mr. Sobisch,

As an enthusiast of new technologies, I am always excited to explore what technology could prevail in the next decade or so, and from there comes my love for Machine Learning and Data science technology. Machine Learning is used in many different aspects of daily life nowadays, basically any field in which we have enough data to recognize patterns and predict them. That's why I would be thrilled to work as a Student Assistant in this domain. I am a master's student at RWTH Aachen studying media informatics.

During college time, I engaged in a lot of competitive programming which I did in C++. And prior to coming to Germany, I have worked in Samsung for 2 years, as a result of that, production-level software creation, team-work, ownership, and other nuances has been bestowed upon me. Last semester I got familiar with many Machine Learning approaches and python language. In this semester, I have the Computer Vision and Advance Process Mining as my main subjects, which are somewhat related to the Machine Learning domain so this will definitely benefit my work. I am also familiar with Python language, as all my assignments and projects here in RWTH are in that.

Considering all the above reasons I find myself fit for working with your team. At a later point, after finishing with my studies I could be your potential employee. Looking forward to hearing from you.

Sincerely,

Praveen Yadav
